

Dalton

Name: Spanish Grand Jimmy
Breed: Welsh Corgi Cardigan
Coat: Chocolate
Weight: Have to get
DNA: Clear/Normal
Height: Have to get
Registration: GCKC, UKC - CKC pending

Personality:

Dalton is our goofy treasure hunter — always on the lookout for special “finds,” which usually include rocks or bits of kid-left yard treasures that he proudly carries over to show Meadow. The two are best friends and almost always together, and I’m convinced they have full conversations when no one’s listening. With his big classic Cardigan ears and happy, easygoing personality, Dalton is wonderful with all of our kids and far less reserved than many Cardigans tend to be. He’s a sweet, cheerful boy who is happiest right by Meadow’s side, soaking up family life.

DALTON

DNA Test Report

Test Date: July 21st, 2025

embk.me/dalton128

BREED-RELEVANT RESULTS

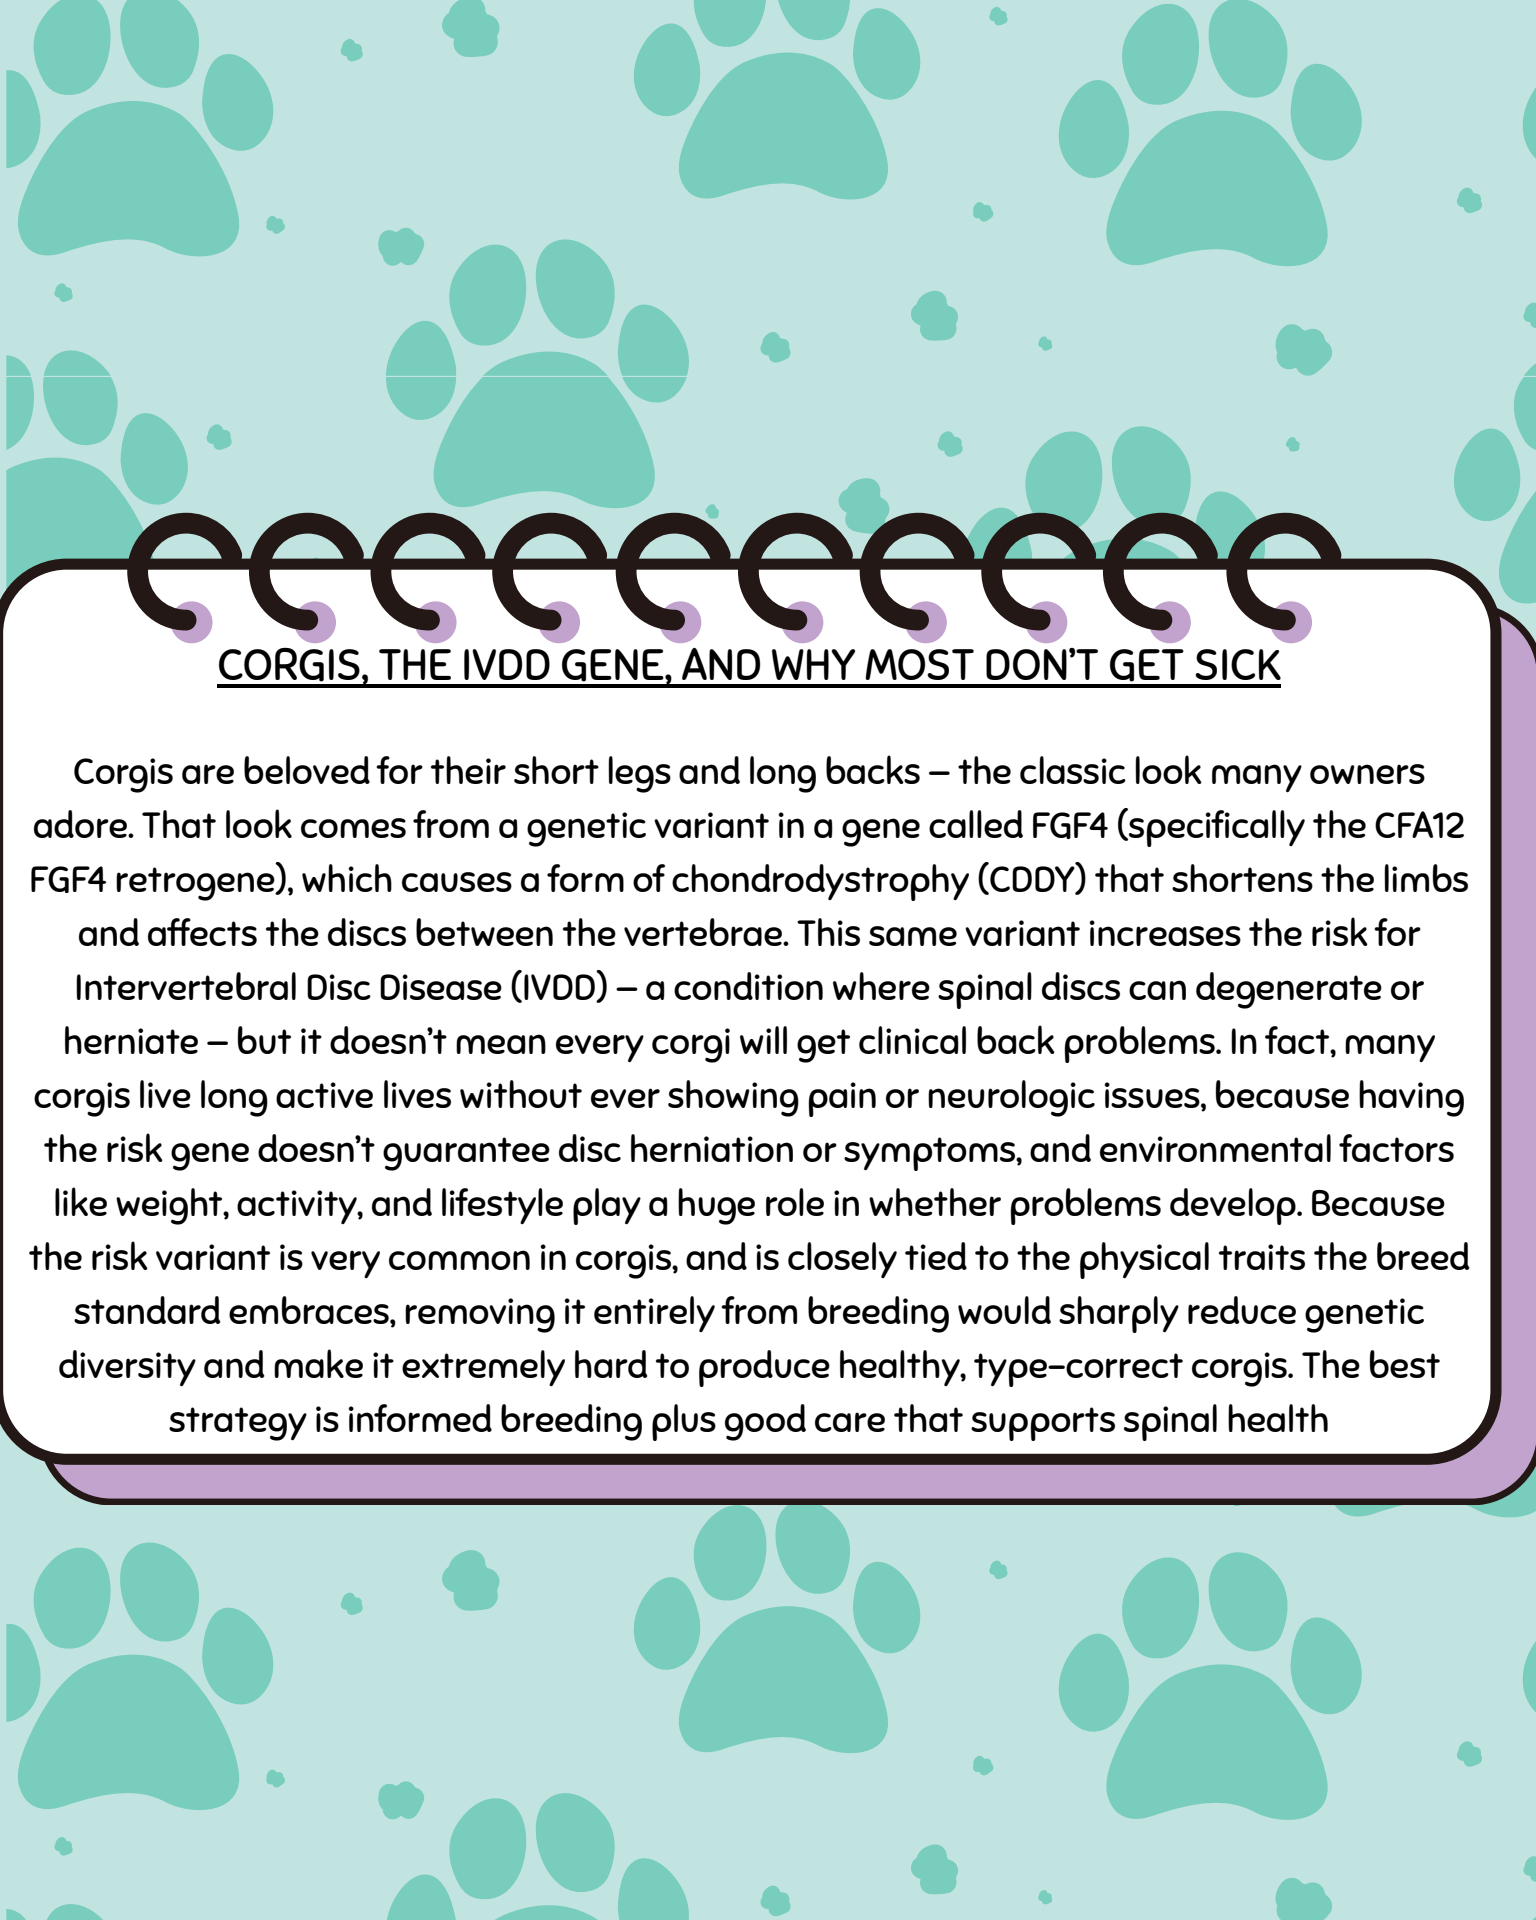

Research studies indicate that these results are more relevant to dogs like Dalton, and may influence his chances of developing certain health conditions.

	Intervertebral Disc Disease (Type I) (FGF4 retrogene - CFA12)	Increased risk
	Degenerative Myelopathy, DM (SOD1A)	Clear
	Exercise-Induced Collapse, EIC (DNM1)	Clear
	Progressive Retinal Atrophy, rcd3 (PDE6A)	Clear
	Von Willebrand Disease Type I, Type I vWD (VWF)	Clear
	X-linked Severe Combined Immunodeficiency, X-SCID (IL2RG, Corgi Variant)	Clear

Registration: United Kennel Club (UKC)

CORGIS, THE IVDD GENE, AND WHY MOST DON'T GET SICK

Corgis are beloved for their short legs and long backs – the classic look many owners adore. That look comes from a genetic variant in a gene called FGF4 (specifically the CFA12 FGF4 retrogene), which causes a form of chondrodystrophy (CDDY) that shortens the limbs and affects the discs between the vertebrae. This same variant increases the risk for Intervertebral Disc Disease (IVDD) – a condition where spinal discs can degenerate or herniate – but it doesn't mean every corgi will get clinical back problems. In fact, many corgis live long active lives without ever showing pain or neurologic issues, because having the risk gene doesn't guarantee disc herniation or symptoms, and environmental factors like weight, activity, and lifestyle play a huge role in whether problems develop. Because the risk variant is very common in corgis, and is closely tied to the physical traits the breed standard embraces, removing it entirely from breeding would sharply reduce genetic diversity and make it extremely hard to produce healthy, type-correct corgis. The best strategy is informed breeding plus good care that supports spinal health
