

Grizzly

Name:	Johnson's Grizzly
Breed:	Pembroke Welsh Corgi
Coat:	Fluffy
Weight:	Have to get
DNA:	Clear/Normal
Height:	Have to get
Registration:	Amerian Kennel Club

Personality:

Grizzly is the fluffiest, happiest, and hungriest Pembroke you've ever met. His coat is so long and full that he looks like a miniature Lassie, and his always-smiling face makes it impossible not to laugh. Grizzly never passes up a treat and will happily offer an entire routine of tricks — unprompted — just in case it earns him a snack for his efforts. He is wonderful with the kids and greets everyone he meets with classic, outgoing Pembroke enthusiasm.

Genetic Summary Report

Health Tests Reported

Breed Diseases Sense	Result
☒ Cone-Rod Dystrophy I - PRA (crd -4/crd I)	NORMAL (N/N) - [NO VARIANT DETECTED]
☒ Degenerative Myelopathy	NORMAL (N/N) - [NO VARIANT DETECTED]
☒ Degenerative Myelopathy Early-Onset Risk Modifier (Pembroke Welsh Corgi Type)	NORMAL (N/N) - [NO VARIANT DETECTED]
☒ Duchenne Muscular Dystrophy (Pembroke Welsh Corgi Type)	NORMAL (N/N) - [NO VARIANT DETECTED]
☒ Exercise Induced Collapse (Retriever Type)	NORMAL (N/N) - [NO VARIANT DETECTED]
☒ Progressive Retinal Atrophy - rcd3 (Corgi/Crested Type)	NORMAL (N/N) - [NO VARIANT DETECTED]
☒ Severe Combined Immunodeficiency Disease, X-Linked (Corgi Type)	NORMAL (N/N) - [NO VARIANT DETECTED]
☒ Sex Determination - ZFX/Y	DOG IS MALE
☒ von Willebrand's Disease Type I	NORMAL (N/N) - [NO VARIANT DETECTED]
Black Hair Follicular Dysplasia	NEGATIVE - NO COPIES, NOT SHOWING THE PHENOTYPE

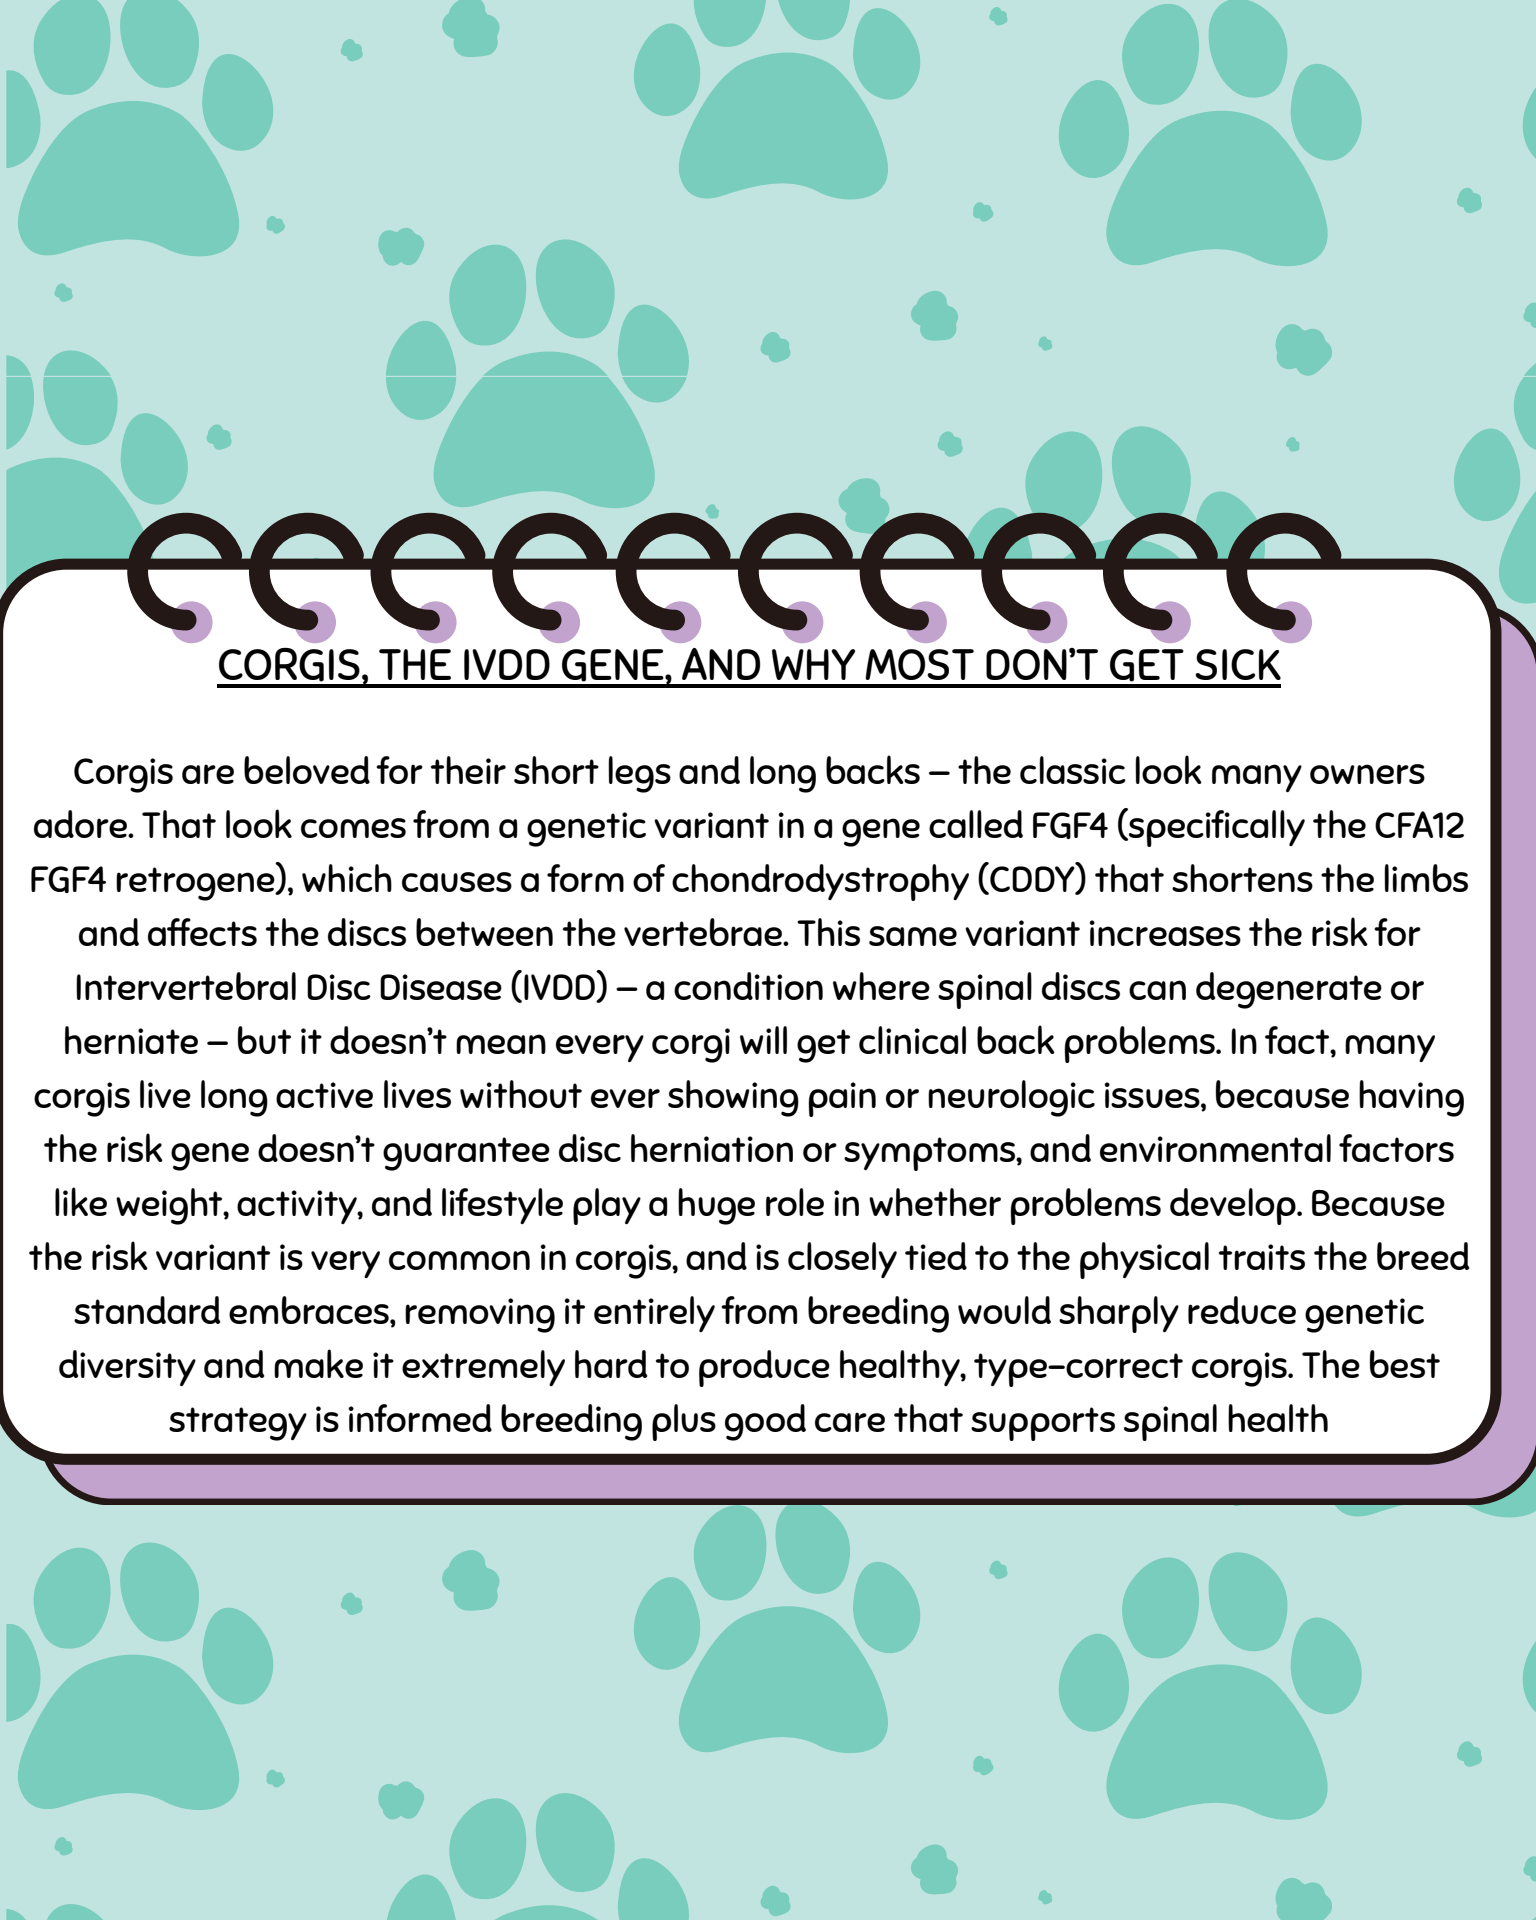

Owner's Name : Erica Allen

Pet Name :Grizzly

Microchip Number

Approved Collection Method :

No

CORGIS, THE IVDD GENE, AND WHY MOST DON'T GET SICK

Corgis are beloved for their short legs and long backs – the classic look many owners adore. That look comes from a genetic variant in a gene called FGF4 (specifically the CFA12 FGF4 retrogene), which causes a form of chondrodystrophy (CDDY) that shortens the limbs and affects the discs between the vertebrae. This same variant increases the risk for Intervertebral Disc Disease (IVDD) – a condition where spinal discs can degenerate or herniate – but it doesn't mean every corgi will get clinical back problems. In fact, many corgis live long active lives without ever showing pain or neurologic issues, because having the risk gene doesn't guarantee disc herniation or symptoms, and environmental factors like weight, activity, and lifestyle play a huge role in whether problems develop. Because the risk variant is very common in corgis, and is closely tied to the physical traits the breed standard embraces, removing it entirely from breeding would sharply reduce genetic diversity and make it extremely hard to produce healthy, type-correct corgis. The best strategy is informed breeding plus good care that supports spinal health
